

CMSC 128.2  
Software Engineering 2

Software Configuration Management – Part 2b

Ma. Sheila A. Magboo

# Git (command line)

- Create a git account
- Click New Repository button
- Provide name for your repository
- Select Private
- Click Create Repository button
- Copy your Git URL
- Install git on your computer (Ex. Git for Windows)

# Git (command line)

- Open terminal in your computer
- Type the following commands
  - `git -version`
  - `mkdir cs128.2`
  - `cd cs128.2`
  - `git clone httpsURL` or your repository
  - Create a `README.md` file which we will put in the repository (.md mean markdown file)
  - `git status` (to see the status of the files in the local repo; note untracked file means not yet tracked since 1<sup>st</sup> time to create the file and no changes done yet)
  - `git add README.md` (to stage the file prior to shipping to online repo)
  - `git status` (Note file is now tracked)
  - `git commit -m "Initial Commit"` (Note commit means the files in the local repository passed testing and ready for shipment to online repo)
  - `git status`
  - `git push origin master` (origin is the branch and master is the default repo; you might be asked for your username and password)
  - `Git status` (message is "your branch is up to date with origin/master, nothing to commit, working tree clean")
  - When you go to github online repo you'll see the updated origin/master

# Git (command line)

- Let's update the README.md and create a new file index.html
- Type `git status` on your terminal (you'll see that README.md is modified and there's also a new untracked file index.html)
- Type `git add index.html` (to stage index.html)
- `git status` (to see the new file added to online repo; note updated README.md is still in local repo)
- `git commit -m "2nd commit → added index.html"`
- `git push origin master` (to send the staged files to online repo)
- `git diff README.md` (to see the changes made to the README.md file)
- `git log` to see the logfile of the commits. Type `q` to quit
- `git checkout 09dfd2309ggdre` (hashcode of the stable commit) (If you messed out with the last commit and you want to go to the previous stable commit; this will make the head revert back to that previously stable commit)

```
C:\Users\Sheila>git --version
git version 2.29.0.windows.1
```

```
C:\Users\Sheila>mkdir cmssc128.2
```

```
C:\Users\Sheila>cd cmssc128.2
```

```
C:\Users\Sheila\cmssc128.2>git clone https://github.com/sheilaabad/codingground.git
Cloning into 'codingground'...
remote: Enumerating objects: 52, done.
remote: Total 52 (delta 0), reused 0 (delta 0), pack-reused 52
Receiving objects: 100% (52/52), 6.72 KiB | 1.34 MiB/s, done.
Resolving deltas: 100% (10/10), done.
```

```
C:\Users\Sheila\cmssc128.2>cd codingground
```

```
C:\Users\Sheila\cmssc128.2\codingground>git status
On branch master
Your branch is up to date with 'origin/master'.

nothing to commit, working tree clean
```

```
C:\Users\Sheila\cmssc128.2\codingground>git status
On branch master
Your branch is up to date with 'origin/master'.
```

```
Untracked files:
  (use "git add <file>..." to include in what will be committed)
      README2.md
```

```
nothing added to commit but untracked files present (use "git add" to track)
```

```
C:\Users\Sheila\cmssc128.2\codingground>
```

To view the git version

To create a clone of the online repository on our local machine

To view the state of the repository and our staging area (or local machine). It allows us to see the tracked, untracked files and changes. This command will not show any commit records or information.

# Command Prompt

```
C:\Users\Sheila\cmssc128.2\codingground>git add README2.md
```

```
C:\Users\Sheila\cmssc128.2\codingground>git status
```

```
On branch master
```

```
Your branch is up to date with 'origin/master'.
```

```
Changes to be committed:
```

```
(use "git restore --staged <file>..." to unstage)
```

```
new file:   README2.md
```

git add tells Git that you want to include updates to a particular file in the next commit. However, git add doesn't really affect the repository in any significant way—changes are not actually recorded until you run git commit

```
C:\Users\Sheila\cmssc128.2\codingground>git commit -m "commit for march 2022"
```

```
[master 50f9810] commit for march 2022
```

```
1 file changed, 1 insertion(+)
```

```
create mode 100644 README2.md
```

```
C:\Users\Sheila\cmssc128.2\codingground>git status
```

```
On branch master
```

```
Your branch is ahead of 'origin/master' by 1 commit.
```

```
(use "git push" to publish your local commits)
```

```
nothing to commit, working tree clean
```

git commit command is used to move files from the staging area to a commit. git commit creates a snapshot of the changes made to a Git repository which can then be pushed to the main repository when the developer is ready to do so.

```
C:\Users\Sheila\cmssc128.2\codingground>git push origin master
```

```
Username for 'https://github.com': sheilaabad
```

```
Password for 'https://sheilaabad@github.com':
```

```
remote: Support for password authentication was removed on August 13, 2021. Please use a personal access token instead.
```

```
remote: Please see https://github.blog/2020-12-15-token-authentication-requirements-for-git-operations/ for more information.
```

```
fatal: Authentication failed for 'https://github.com/sheilaabad/codingground.git/'
```

git push origin master pushes your master branch to the origin. Error here because git requires setup of git token in your local drive

```
C:\Users\Sheila\cmssc128.2\codingground>
```

# A short note on git push

From August 13, 2021, GitHub is no longer accepting account passwords when authenticating Git operations. You need to add a **PAT (Personal Access Token)** instead, and you can follow the below method to add a PAT on your system.

## Create Personal Access Token on GitHub

From your GitHub account, go to **Settings => Developer Settings => Personal Access Token => Generate New Token** (Give your password) => **Fillup the form => click Generate token => Copy the generated Token**, it will be something like

```
ghp_sFhFsSHhTzMDreGRLjmks4Tzuzgthdvfsrta
```

Now follow below method based on your machine:

## For Windows OS

Go to **Credential Manager** from **Control Panel => Windows Credentials** => find `git:https://github.com` => **Edit** => On Password replace with with your **GitHub Personal Access Token** => You are Done

If you don't find `git:https://github.com` => Click on **Add a generic credential** => Internet address will be `git:https://github.com` and you need to type in your username and password will be your **GitHub Personal Access Token** => Click Ok and you are done

```
git push origin master
```

we should be able see already the README2.md
